Insight & Interpretation

1. Actionable Insight to Reduce Returns

One actionable insight is that a small number of products and regions appear to drive a disproportionate share of total returns. By isolating those SKUs with high Return Cost % and cross-checking with customer comments or defect codes, the business can take targeted corrective action such as quality checks or supplier adjustments. Reducing returns in just these “top offenders” would improve both margin and customer satisfaction.

2. Suspicious or Unexpected Pattern

A suspicious pattern is that several orders appear with missing product cost or mismatched product categories compared to the Products table. This can artificially inflate or deflate margin calculations, making performance appear better or worse than reality. It may indicate data entry issues, stale master data, or incomplete ETL processes, and could distort financial reporting if not corrected.

3. Single Weekly Metric for Leadership

The most important weekly metric to spotlight is **Rolling 12-Month Net Sales**. It smooths out month-to-month volatility and provides a clear view of whether the business is growing or declining in a meaningful trend. Leadership cares most about sustained trajectory, not isolated spikes, making this the most reliable performance indicator for decision-making.

4. One Improvement to the Dataset Before Deployment

Before deploying the dashboard, I would standardize and validate product master data—especially cost, category, and hierarchy fields. These fields are essential for accurate margin, return cost, and segmentation analysis, and inconsistencies introduce noise into multiple KPIs. Implementing basic data quality rules at the source system would greatly improve the reliability of the entire model.

Insight Questions

1. Which products contribute most to revenue, and how does this change over time?
2. Which customer segments are driving growth or decline?
3. How do monthly or yearly trends compare against prior periods?
4. Are there anomalies or data quality issues affecting performance visibility?
